Machine Learning for First Episode Psychosis

Databases: EMBASE, Medline, PsychINFO

Search Strategy: (“machine learning” OR “artificial intelligence” OR “artificial neural network”) AND "first episode psychosis"

Limits: 1998 – 2019

Contents

"A New Machine Learning Framework for Understanding the Link Between Cannabis Use and First-Episode Psychosis." ................................................................. 3

"Classifying individuals at high-risk for psychosis based on functional brain activity during working memory processing." ................................................................. 3

"Distinguishing prodromal from first-episode psychosis using neuroanatomical single-subject pattern recognition." ......................................................................................... 3

"Using multi-modal MRI data to classify patients with first episode psychosis." ................................................................. 3

"The Early Psychosis Screener (EPS): Quantitative validation against the SIPS using machine learning." ................................................................. 3

"Machine learning reveals deviance in neuroanatomical maturity predictive of future psychosis in youth at clinical high risk." ................................................................. 3

"Phonetic measures of reduced tongue movement correlate with negative symptom severity in hospitalized patients with first-episode schizophrenia-spectrum disorders." ................................................................. 3

"Quantifying anatomical and functional heterogeneity in big datasets, using machine learning methods towards a dimensional neuroimaging framework." ................................................................. 3

"Using support vector machine approaches to identify the neuroanatomical predictors of short and long-term outcome in first episode psychosis." ................................................................. 3

"Investigating brain structural patterns in first episode psychosis and schizophrenia using MRI and a machine learning approach." ................................................................. 4

"Identifying a neuroanatomical signature of schizophrenia, reproducible across sites and stages, using machine learning with structured sparsity." ................................................................. 4

"Obesity, dyslipidemia and brain age in first-episode psychosis." ................................................................. 4

"Multisite prediction of 4-week and 52-week treatment outcomes in patients with first-episode psychosis: a machine learning approach." ................................................................. 4
"Multisite prediction of 4-week and 52-week treatment outcomes in patients with first-episode psychosis: A machine learning approach': Correction." ................................................................. 4
Reports an error in 'Multisite prediction of 4-week and 52-week treatment outcomes in patients with first-episode psychosis: A machine learning approach'. ................................................................. 4
"Classification of first-episode psychosis in a large cohort of patients using support vector machine and multiple kernel learning techniques." ........................................................................... 4
"Multi-center MRI prediction models: Predicting sex and illness course in first episode psychosis patients." ............................................................................................................... 4
"Non literal language comprehension in a large sample of first episode psychosis patients in adulthood." .................................................................................................................... 5
"Classification of first-episode psychosis: a multi-modal multi-feature approach integrating structural and diffusion imaging." .................................................................................... 5
"An empirical comparison of different approaches for combining multimodal neuroimaging data with support vector machine." ................................................................................................ 5
"Using genetic, cognitive and multi-modal neuroimaging data to identify ultra-high-risk and first-episode psychosis at the individual level." .................................................................................. 5
"Predicting 12-month outcome in first-episode psychosis at the individual level using clinical, MRI and cognitive data: A support vector machine study." ................................................................. 5
"Predictors of schizophrenia spectrum disorders in early-onset first episodes of psychosis: a support vector machine model." ........................................................................................................... 5
"Using deep belief network modelling to characterize differences in brain morphometry in schizophrenia." ................................................................................................................................. 5
"Using deep belief network modelling to characterize differences in brain morphometry in schizophrenia." ................................................................................................................................. 5
"Precuneus functioning differentiates first-episode psychosis patients during the fantasy movie Alice in Wonderland." ................................................................................................................ 6
"Neuroanatomical pattern classification in unmedicated first-episode psychosis: Influence of different imaging feature selection." .......................................................................................... 6
"The use of dynamic susceptibility contrast (DSC) MRI to automatically classify patients with first episode psychosis." ........................................................................................................... 6
"Is It Possible to Predict the Future in First-Episode Psychosis?" ........................................................................................................................................................................... 6
"Using machine learning to predict outcomes in psychosis." ........................................................................................................................................................................... 6
"Neuroanatomical pattern classification in a population-based sample of first-episode schizophrenia." ................................................................................................................................. 6
